

Building Rwanda's capital market for profitable private businesses

Rozine connects everyday and institutional investors to audited, cash-flow-verified Rwandan SMEs raising collateral-free growth capital — with fixed monthly repayments, independent CPA co-signature, and a liquid secondary market.

Prepared by Rozine Technologies Ltd · Kigali, Rwanda · July 2026 · Strictly confidential

THE THESIS IN FIVE LINES

1. Rwanda's profitable small businesses cannot borrow, because banks price collateral, not cash flow.
2. Rwanda's savers cannot invest, because there is no retail-accessible private-credit product between a 7% deposit and a risky side hustle.
3. Both failures share one root cause: **nobody can cheaply verify that a small business actually earns what it says it earns.**
4. Rozine solves verification with machine-parsed bank/MoMo statements co-signed on-site by ICPAR-accredited CPAs — then turns the verified cash flow into a tradable, fixed-return note.
5. We monetise the rails, not the risk: five thin fees on origination, servicing and liquidity — no balance sheet, no lending licence exposure.

Executive summary

Rozine is a capital marketplace. On one side, profitable Rwandan businesses raise growth capital without collateral. On the other, ordinary Rwandans and institutions invest from as little as RWF 5,000 into audited, cash-flow-verified notes that pay a fixed total return of 10–15% over 3 to 12 months.

We are not a lender. We do not take deposits, we do not hold credit risk on a balance sheet, and we do not intermediate money as principal. Rozine operates the *infrastructure*: underwriting, verification, listing, servicing, reporting and secondary liquidity. Capital flows from investor to business; we take a thin, transparent fee at each point where we add measurable value.

What makes Rozine defensible

Pillar	What it is	Why it is hard to copy
Statement-parsed underwriting	OCR ingestion of 6–24 months of bank and MoMo statements; automated derivation of gross inflow, outflow, volatility, seasonality and debt service capacity.	Requires a parsing corpus tuned to Rwandan bank and MoMo formats — accumulated, not bought.
The Audit Partner network	ICPAR-accredited CPAs who physically visit each borrower monthly, capture geo-tagged evidence, and co-sign the report under ISRS 4400 agreed-upon procedures.	A licensed, contractually bound, geographically distributed human network — years to build, immediately trusted.
The unified rating	One number and one word (Strong / Stable / Weak / Distressed, 0.0–5.0) computed from verified cash flow, replacing every competing score.	Only meaningful when backed by verified data; a score on self-reported numbers is worthless.
The secondary market	Investors exit before maturity by selling notes to other investors at a market price.	Liquidity is a network effect: it improves as the book grows and cannot be bootstrapped by a new entrant.
Regulatory position	Sequenced entry via the Rwanda Capital Market Authority (RCMA) regulatory sandbox, with demand proven before capital is at risk.	First-mover licence in a jurisdiction that grants few.

The ask

We are raising a seed round to complete the platform, run the Pulse demand campaign, onboard the first cohort of Audit Partners, and enter the RCMA sandbox with live volume. Detailed use of funds appears in Section 15.

The problem

2.1 The business side: profitable, bankable, unbanked

A Rwandan business can be genuinely profitable — steady MoMo receipts, real margins, a growing customer base — and still be structurally unable to borrow. The reason is not risk. The reason is **collateral**.

Commercial lending in Rwanda is underwritten against pledged assets: land title, vehicles, machinery. A distributor with RWF 40M in annual throughput but no title deed is, in the eyes of a bank's credit committee, uncreditworthy — regardless of how reliably cash arrives. The consequence is a class of businesses that are too big for microfinance, too asset-light for commercial credit, and therefore frozen at exactly the size where capital would compound fastest.

The alternatives are worse. Informal lenders charge rates that destroy the very margin the loan was meant to grow. Supplier credit is short and relationship-dependent. Equity is premature and, for most owners, unwelcome — they do not want a partner, they want inventory.

WHAT THE BUSINESS ACTUALLY NEEDS

Not a bigger loan. A *right-sized* one — an amount its own cash flow can service, on a fixed repayment it can plan around, priced on performance rather than on what it owns.

2.2 The investor side: savings with nowhere to go

The mirror image of the credit gap is a yield gap. A Rwandan with RWF 500,000 in savings has a narrow menu: a bank deposit paying single digits, treasury instruments with high minimums and long lock-ups, listed equities on a thin exchange, or informal lending with no recourse. Property is the default — but it is illiquid, lumpy and inaccessible below several million francs.

What does not exist is the middle: a product where a person can put a modest sum to work, for a known term, at a known return, into something they can actually understand — a real business, in their own country, whose numbers have been checked by a professional.

2.3 The root cause: verification is expensive

Both sides of the market fail for one shared reason. Verifying that a small business earns what it claims has historically required either a full audit (too costly relative to a RWF 20M facility) or trust in self-reported figures (worthless as an investment basis).

Every attempted solution to SME finance in the region has stumbled here. Lend on self-reported revenue and you underwrite fiction. Demand an audit and the economics collapse. **Rozine's entire architecture exists to make verification cheap enough to be routine and rigorous enough to be investable.**

The solution

Rozine turns a verified cash flow into a tradable instrument. The mechanism has four moving parts.

3.1 Machine verification, human attestation

A business applying to Rozine uploads its bank and mobile-money statements — not a business plan, not projections, not a self-declared revenue figure. Our parsing engine reads the documents, reconstructs the cash-flow history, and computes a defensible picture of what actually moves through the business.

Machine parsing alone, however, cannot confirm that the business is real, that the premises exist, or that inventory is on the shelf. So every listing and every monthly report is co-signed by an **Audit Partner**: an ICPAR-accredited CPA who visits the business in person, captures geo-tagged photographic evidence through the Rozine Auditor app, performs agreed-upon procedures under ISRS 4400, and applies a cryptographic verification seal.

Machines make verification cheap. Licensed humans make it credible. Neither alone is sufficient; together they are the product.

3.2 Capacity-based sizing

Rozine never asks a business how much it wants. We compute how much it can safely service from verified cash flow, and offer that. A business may raise less than its capacity; it may never raise more. This single rule is the platform's most important risk control, because it makes over-lending structurally impossible rather than merely discouraged.

3.3 Fixed total return, not APR

A note carries a **flat total return** — a single percentage of principal, paid across the life of the note — with a floor of 10% and a ceiling of 15%, regardless of tenor. A RWF 100,000 investment at 12% returns RWF 112,000 in total, whether the term is three months or twelve.

This is a deliberate departure from annualised pricing, and it is the correct one for this market for three reasons:

- **Comprehension.** "You get RWF 112,000 back" is understood by every investor. "12% APR over 90 days" is understood by almost none.
- **Short-tenor viability.** Under APR, a 3-month note pays a trivial absolute amount and nobody funds it — which would kill exactly the seasonal, harvest-cycle, inventory-turn borrowing that Rwandan SMEs most need. The flat floor makes every tenor worth funding.
- **Honest incentives.** Because the total cost is fixed, a business that repays early pays no less — so it borrows for the term it actually needs rather than gaming the clock, and the investor's return is never eroded by prepayment.

The trade-off is explicit and accepted: a 12-month note is better value per franc-year for the business, and a short note is proportionally expensive. We publish this plainly. Businesses choose their own tenor.

3.4 Monthly proof, enforced

Verification is not a one-time gate. Between the 1st and 7th of every month, each funded business must upload fresh statements and receive an on-site Audit Partner co-signature. The resulting report — parsed inflow and outflow, liquidity coverage, health status, business and auditor photographs, and the verification seal — is published to every investor holding that note.

Missing the window has consequences, not reminders. Late reports trigger SLA escalation; unremedied breaches freeze the Audit Partner's yield share and flag the note across the platform. Investors therefore hold an instrument whose underlying performance is re-proven every thirty days.

The platform

Rozine ships as five coordinated applications over one shared transactional core. Every entity — party, note, order, report, ledger entry, policy — lives in a single source of truth, so an action in one app propagates instantly to the others.

Application	User	Purpose
Investor app	Retail & institutional investors	Discover deals as a swipeable deck; inspect verified financials, ratings and audit evidence; invest from RWF 5,000; track a portfolio; receive monthly verified updates; trade on the secondary market; manage a wallet.
Business app	Borrowing SMEs	Onboard and verify identity; upload statements; see computed capacity and rating; create and manage a raise; submit the monthly report; track repayments and standing.
Auditor app	ICPAR Audit Partners	Receive dispatched jobs within a 30 km radius; run 24-hour Flash Audits; capture geo-tagged evidence on site; co-sign reports; track the 25% yield share; complete continuing-education modules.
Admin console	Rozine staff	Total command over every object and action in the ecosystem: underwriting policy, ICPAR licence verification, spatial dispatch, SLA enforcement, treasury and ledger, compliance cases, per-app feature flags, role-based access and a full audit trail.
Rozine Pulse	Pre-launch public	Demand-aggregation portal: investors register pledges, businesses pre-qualify by uploading a statement, and both receive a shareable pass. Generates the evidence base for the regulatory application.

4.1 Why a four-sided architecture

Most lending platforms build two apps and treat the auditor as a spreadsheet. That choice caps the model: verification stays manual, slow and unauditable, and the platform cannot scale past the founders' personal oversight.

By making the Audit Partner a first-class user with a purpose-built application, verification becomes a productised, dispatchable, measurable workflow — with SLAs, telemetry, spatial routing and its own compensation rail. This is what allows one Rozine operations team to supervise thousands of monthly audits rather than dozens.

The underwriting engine

Rozine's credit logic is deterministic, auditable and published. There is no black box: a business can see exactly why it received the capacity, rating and yield it did, and a regulator can reconstruct any decision from stored inputs.

5.1 Cash flow available for debt service

From the parsed statement history we derive, per month, gross inflow and gross outflow. Net operating cash flow is their difference; CFADS is that figure adjusted for owner drawings, non-recurring items and existing debt obligations, then trimmed for volatility so that a single exceptional month cannot inflate capacity.

CORE FORMULAS

$$NOCF_m = Inflow_m - Outflow_m$$
$$CFADS = trimmed_mean(NOCF) - ExistingDebtService - OwnerDraw$$
$$DSCR = CFADS \div ProposedMonthlyRepayment$$
$$Capacity = (CFADS \times TargetDSCR^{-1} \times Tenor) \div (1 + TotalReturn)$$

Figure 1 — Capacity is solved backwards from serviceable monthly repayment, never forwards from a requested amount.

5.2 Decision tiers

Tier	DSCR band	Treatment
Tier 1 — auto-approve	$\geq 1.25\times$	Cleared by the engine subject to Audit Partner co-signature and KYB completion.
Tier 2 — audit band	$1.00\times - 1.25\times$	Requires enhanced on-site procedures and manual underwriter approval; capacity is reduced.
Tier 3 — decline	$< 1.00\times$	Rejected. The business receives its computed figures and specific, actionable guidance on what must change.

Declines are not dead ends. A rejected business keeps its Rozine profile, continues to upload statements, and is automatically re-scored as its cash flow improves — converting today's rejection into tomorrow's pipeline.

5.3 Pricing

Total return is a function of the rating and the tenor, bounded by the platform floor and ceiling. A stronger business borrows more cheaply; a longer tenor carries a higher total return because the investor's capital is committed for longer. Every note lands between 10% and 15% inclusive.

The rating

Rozine publishes exactly one measure of quality. Early designs carried both a 0–100 platform score and a separate risk scale; we deliberately collapsed them, because two competing numbers force every user to ask which one matters and erode trust in both.

The unified rating is expressed on a **0.0–5.0 scale with one decimal**, always paired with a plain-language band and a colour. The word leads, the number supports, the colour reinforces.

Band	Rating	Meaning to an investor
Strong	4.0 – 5.0	Deep, stable, well-covered cash flow with a clean verification history. Selective by design — most healthy businesses will not qualify, and that is the point.
Stable	3.0 – 3.9	Sound and serviceable. The healthy default for an ordinary, well-run business; not a warning.
Weak	2.0 – 2.9	Thin coverage or volatile receipts. Investable only with the elevated return that accompanies it.
Distressed	Below 2.0	Impaired. Not listable; existing notes enter active monitoring and recovery.

Two design decisions deserve explanation. First, the scale is out of five rather than one hundred: a five-point scale with one decimal is instantly legible to a first-time investor, carries no false precision, and mirrors the rating vocabulary people already use everywhere else in daily life. Second, the "Strong" floor sits at 4.0 rather than at the midpoint — so that "Strong" means genuinely exceptional, and businesses have something real to strive toward instead of a label handed out for being merely above average.

The Audit Partner network

The Audit Partner network is Rozine's most distinctive asset and its hardest-won moat. It converts audit from a cost centre into a distributed, incentive-aligned workforce.

7.1 Lifecycle

1. **Signup and biometrics** — identity capture and device binding.
2. **ICPAR licence verification** — membership number and practising certificate checked against the register, with expiry tracking and manual override at the Admin verification desk.
3. **In-app engagement signing** — the master services agreement and ISRS 4400 agreed-upon-procedures terms are executed inside the app.
4. **Spatial dispatch** — jobs are routed to accredited partners within a 30 km radius of the business, subject to live capacity limits.
5. **On-site inspection** — premises visit, procedures performed, geo-tagged photographs captured in-app (camera only; no gallery uploads).
6. **Verification seal** — a cryptographic hash binding auditor identity, licence, report contents and timestamp.
7. **Yield routing** — the partner earns 25% of the service fee collected on every note they steward, paid monthly on satisfactory SLA performance.

7.2 Why CPAs participate

An ICPAR-accredited accountant in Rwanda typically serves a modest local client base with lumpy, seasonal fee income. Rozine offers recurring monthly work within their own district, dispatched automatically, performed in a structured app, and compensated as a share of a growing yield stream rather than a one-off fee. As the notes they steward mature and renew, their income compounds.

The alignment is exact: the partner is paid from the fee stream that only continues if the business keeps performing and keeps reporting. A partner who signs carelessly loses the annuity.

7.3 Controls against capture

- **Rotation.** No partner may steward the same business indefinitely; assignments rotate on a fixed cycle.
- **Concurrency caps.** Each partner carries a maximum number of live engagements, enforced by the dispatcher.
- **Evidence integrity.** Photographs must be captured in-app with live geolocation; EXIF and coordinates are stored and cross-checked against the registered premises.
- **Flash Audits.** Randomly triggered 24-hour re-verifications test both the business and the partner.
- **Yield freeze.** Admin can suspend a partner's payout pending investigation of any discrepancy, dispute or SLA breach.
- **Full audit trail.** Every admin action against a partner is logged with actor, reason and timestamp.

Business model

Rozine earns from five thin, transparent fees. We take no spread on the investor's return, hold no principal risk, and never earn more when a business struggles.

Fee	Rate	Paid by	Trigger
Listing fee	Fixed	Business	On successful listing of a raise, after underwriting and co-signature.
Service fee	2% of repayment	Business	Monthly, on each scheduled repayment. 25% of this is routed to the Audit Partner.
Repayment fee	1% of payout	Investor	On each payout received.
Secondary fee	3% of trade	Seller	On each secondary-market transaction.
Float & treasury	Variable	—	Yield on undeployed balances held in segregated accounts, within regulatory limits.

8.1 Why this structure is the right one

It is capital-light. Revenue scales with volume through the platform, not with a balance sheet we must fund and provision. Growth does not require ever-larger equity raises to support ever-larger loan books.

It is aligned. The largest single line — the service fee — is collected only when a business actually repays. If borrowers stop performing, our revenue stops with them. We cannot profit from distress.

It funds its own quality control. A quarter of the service fee pays the Audit Partner. Verification is not an overhead we are tempted to cut; it is a variable cost that scales precisely with the book it protects.

It compounds through liquidity. The secondary fee grows with trading activity, which grows with book size and investor count — a revenue line that improves as the network matures, at almost no incremental cost.

Market

Rwanda is the right first market for a verification-led capital marketplace, for reasons that are structural rather than sentimental.

- **Digital payment penetration is high.** Mobile money is the default transaction rail for small businesses, which means the raw material for statement-based underwriting already exists in machine-readable form — the single precondition our model depends on.
- **Formalisation is advanced.** Business registration and digital identity infrastructure are unusually strong for the region, lowering KYB friction and fraud exposure.
- **The regulator is engaged.** The Capital Market Authority operates a genuine sandbox pathway, and national policy actively favours capital-market deepening and SME financing.
- **The professional body exists.** ICPAR provides an accredited, disciplinable pool of accountants — without which the Audit Partner model could not be built at all.
- **The market is legible.** Rwanda is small enough to reach comprehensively and to prove a model definitively, which is exactly what a regulator and a future regional expansion both require.

9.1 Segments we serve first

Our initial focus is on businesses with verifiable digital receipts and short working-capital cycles, where the case for revenue-based finance is strongest and the verification signal is cleanest: distribution and wholesale, agri-processing and seasonal trade, retail and pharmacy chains, logistics, light manufacturing, and established service firms with recurring contracts.

9.2 The investor base

We build the retail side deliberately, in three concentric rings: salaried professionals in Kigali who already save digitally; the diaspora, who want a productive channel into the domestic economy beyond remittance and property; and institutions — SACCOs, cooperatives, funds and family offices — for whom Rozine notes offer a verified, short-duration, domestically denominated asset with no origination overhead.

The RWF 5,000 minimum is a strategic instrument, not a marketing gesture. It converts saving from an act of accumulation into an act of participation, and it makes the platform's growth a function of how many Rwandans join rather than how few large cheques we can secure.

Go-to-market

Rozine's launch sequence is designed so that each stage de-risks the next, and so that we arrive at the regulator with evidence rather than intentions.

Stage 1 — Institutional partnerships

We do not acquire businesses one at a time. We partner with the organisations that already convene, train and finance them: enterprise-development networks, the private-sector federation and its ICT chamber, business-development advisory bodies, and existing SME investors and accelerators.

Each partnership is structured around a concrete ask rather than a logo exchange: qualified referrals from their portfolio, a pilot cohort, co-designed eligibility criteria, or co-investment alongside the crowd. For the partner, Rozine solves a problem they already have — their graduates are investment-ready but uninvestable, and they lack a capital instrument to hand them.

Stage 2 — Rozine Pulse

Pulse is a public, pre-launch demand-aggregation campaign, and it is the strategic heart of the go-to-market.

Investors register a non-binding pledge — an amount they intend to invest at launch. Businesses upload a single statement and receive an instant, real pre-qualification: the loan amount they would qualify for, their rating and their indicative yield. Both sides receive a designed, shareable pass that they distribute themselves, turning every participant into a distribution channel.

Pulse delivers four things simultaneously, before a single franc is at risk:

- **Quantified demand** on both sides — the exact evidence a regulator asks for.
- **A warm launch book** — businesses pre-qualified and investors pre-committed on day one.
- **A live test of the parsing engine** against real statements at volume.
- **Brand and virality** at near-zero acquisition cost, through the shareable pass.

Critically, Pulse collects no money and issues no instrument. It is a demand simulation, labelled as such, and therefore sits cleanly outside regulated activity.

Stage 3 — RCMA sandbox entry

With demand proven, the platform built and the Audit Partner cohort accredited, we enter the Capital Market Authority's regulatory sandbox: live operation at controlled scale, under defined caps and supervisory reporting.

Stage 4 — Full licence and scale

Sandbox performance data supports the application for a full operating licence, after which caps are lifted, the institutional investor channel opens fully, and the model is prepared for regional extension into markets with comparable mobile-money penetration and professional-accountancy infrastructure.

Regulatory strategy

Rozine is being built regulator-first. Compliance is a design constraint expressed in the architecture, not a document produced afterwards.

11.1 Our position

Rozine operates a marketplace for investment instruments. We are not a deposit-taking institution and not a lender of record. Investor funds are held in segregated accounts, never commingled with operating capital; the platform matches capital to instruments and services them.

11.2 Controls already built

Requirement	How the platform satisfies it
KYC / KYB	Identity and business verification with document capture, registry checks and tiered verification states enforced before any transaction.
AML monitoring	Transaction surveillance, case management, freeze and reversal powers, and an immutable admin action log.
Segregation of funds	Investor balances held separately from company funds, with a full double-entry ledger.
Disclosure	Every listing carries verified financials, the rating and its basis, the fee schedule, and explicit risk warnings.
Ongoing reporting	Mandatory monthly CPA co-signed reports published to holders, with enforced SLAs.
Governance	Role-based access control, dual-approval on sensitive actions, and a complete audit trail of every administrative decision with actor and stated reason.
Consumer protection	Investment limits, plain-language risk education, a dispute-resolution workflow, and a documented recovery process.

The Admin console was built so that a supervisor could, in principle, be given a read-only seat and see the entire operating state of the market in real time. That is the standard we hold ourselves to.

Competition

Alternative	Where it falls short
Commercial banks	Underwrite collateral, not cash flow. Slow, document-heavy, and structurally unable to serve asset-light businesses at this ticket size.
Microfinance & SACCOs	Serve a smaller ticket band with group-liability mechanics; cannot fund the RWF 10–100M growth step.
Digital nano-lenders	Very short tenor, very high effective cost, algorithmic and unverified. Solves liquidity, not growth.
Impact funds & accelerators	Deep diligence but tiny throughput and long timelines; equity-shaped for founders who want debt.
Informal lending	Fast and flexible, but rates destroy margin and there is no recourse for either party.
Regional crowdfunding platforms	Rely on self-reported figures and one-time diligence. No independent monthly attestation, no liquidity, no licensed verification layer.

The competitive question is not "who else lends to SMEs" — many do. It is **"who else can prove, every single month, at a cost of a few thousand francs, that a small business is performing?"** Today, nobody. That capability is the company.

Risk & mitigation

Risk	Exposure	Mitigation
Borrower default	Investor capital impaired; platform trust damaged.	Capacity-based sizing with DSCR floors; monthly verified reporting; early-warning health status; graduated collections and documented recovery; full loss disclosure at the point of investment.
Statement fraud	Forged or edited documents inflate capacity.	Machine parsing with anomaly detection; independent on-site CPA attestation; geo-tagged evidence; random Flash Audits; permanent platform ban and referral for confirmed fraud.
Auditor collusion	A partner signs off on a business they should not.	Rotation, concurrency caps, in-app camera-only evidence, licence-linked accountability with ICPAR, yield freeze pending investigation, and Flash Audit sampling.
Regulatory delay	Launch timing slips.	Sequenced entry via the sandbox; Pulse generates evidence and market presence during the waiting period at no regulatory exposure; controls built ahead of requirement.
Liquidity mismatch	Investors need exit before maturity.	Secondary market with transparent pricing; short tenors of 3–12 months by design; clear communication that early exit depends on a willing buyer.
Concentration	A sector or region shock hits many notes at once.	Sector and geographic exposure caps enforced in policy; portfolio diversification prompts to investors; admin-level concentration monitoring.
Platform trust event	A single visible failure disproportionately damages a young marketplace.	Conservative early underwriting, deliberately small first cohorts, transparent public reporting of performance including losses, and a strict no-guarantee posture — we never imply capital protection.

Technology

The prototype is complete across all five applications on a single shared transactional core, with the full entity model, lifecycle state machine, policy engine, ledger and admin command surface implemented and demonstrable. Production build-out proceeds along four tracks.

Track	Scope
Core services	Production backend, authentication and session management, double-entry ledger of record, event bus, idempotent transaction handling, and disaster recovery.
Parsing engine	Statement ingestion across every major Rwandan bank and MoMo format; OCR and layout inference; transaction classification; anomaly and tamper detection; continuous accuracy benchmarking against auditor-confirmed ground truth.
Integrations	Payment rails for disbursement and collection, mobile-money APIs, identity and business-registry verification, and supervisory reporting endpoints.
Trust & security	Encryption in transit and at rest, key management, tamper-evident verification seals, immutable audit logging, penetration testing, and data-protection compliance.

14.1 Engineering principles

- **One source of truth.** Every app reads and writes the same core. No app owns private state that others must guess at.
- **Deterministic and reconstructible.** Any decision — capacity, rating, price, dispatch — can be recomputed from stored inputs and explained to a user or a regulator.
- **Money is a ledger, never a field.** No balance is ever mutated; balances are derived from immutable entries.
- **Policy as data.** Underwriting thresholds, fees, caps and SLAs are configurable and versioned, not hard-coded — so the business can be tuned without a deploy, and every change is attributed.
- **Offline-tolerant field capture.** The Auditor app must function at a rural business premises with poor connectivity and sync reliably afterwards.

Roadmap, funding & metrics

15.1 Sequence

Phase	Objective	Exit criteria
Phase 1	Pulse campaign and partnership execution	Signed institutional partners; a substantial verified pledge book; a pre-qualified business pipeline; parsing engine validated on real statements at volume.
Phase 2	Production build and Audit Partner accreditation	Core services live; payment rails integrated; first cohort of ICPAR partners onboarded, trained and contracted; security review passed.
Phase 3	RCMA sandbox operation	Live notes originated, funded, serviced and repaid under supervision; complete monthly reporting record; measured default and recovery experience.
Phase 4	Full licence and scale	Licence granted; caps lifted; institutional channel opened; secondary market at depth; regional expansion prepared.

15.2 Use of funds

Area	Purpose
Engineering	Senior platform and data engineering to take the prototype to production; the parsing engine is the single highest-leverage investment.
Audit Partner network	Recruitment, accreditation, training, certification and field equipment for the first partner cohort.
Regulatory & legal	Sandbox application, legal structuring, instrument documentation, compliance programme and data-protection work.
Go-to-market	Pulse campaign, partnership execution, investor education and brand.
Operations	Underwriting, compliance and support staffing; treasury and controls.
Reserve	Runway buffer against regulatory timing.

15.3 The metrics we manage against

Metric	Why it is the right one
Capital deployed	The primary volume measure; every fee line scales from it.
Time to fund	Days from listing to fully funded — the clearest signal of investor-side demand health.
Report SLA compliance	Percentage of monthly reports co-signed and published within the 1st–7th window. This is the trust metric; it must stay near-perfect.
Portfolio at risk	Share of outstanding principal in arrears, by band and by cohort.
Parsing accuracy	Machine-derived figures versus auditor-confirmed ground truth — the leading indicator of underwriting quality.
Repeat rate	Businesses returning for a second raise, and investors reinvesting at maturity. The truest measure of whether the product works.
Secondary depth	Trade volume and time-to-fill — the health of the liquidity promise.

Vision

The near-term goal is a functioning, licensed capital marketplace in Rwanda where a profitable business can raise growth capital in days on the strength of its own cash flow, and where an ordinary Rwandan can put RWF 5,000 to work in that business and be told the truth about it every month.

The longer arc is larger. Every note Rozine originates, verifies, services and either repays or recovers becomes a permanent, structured record of small-business performance in an economy where no such record has ever existed at scale. Over years, that accumulated history becomes the credit infrastructure of the private sector itself — the dataset against which capacity can be assessed, risk can be priced, and capital can finally be allocated on evidence rather than on collateral.

The Audit Partner network extends the same logic to the profession: a distributed, digitally equipped, continuously trained corps of accountants whose work is not an annual compliance exercise but a monthly act of market-making.

And the model is portable. Any market with meaningful mobile-money penetration and a functioning professional-accountancy body has the two preconditions Rozine requires. Rwanda is where we prove it — deliberately, completely, and in full view of the regulator — because a model proven here can be trusted anywhere.

WHAT WE ARE ACTUALLY BUILDING

Not a lending app. A market — with its own instrument, its own price, its own liquidity, its own verification profession, and its own public record of who performed and who did not. Rwanda has a stock exchange for its largest companies. Rozine is the capital market for everyone else.

Reference

A. Product parameters

Parameter	Value
Tenors offered	3, 6, 9 or 12 months
Total return to investor	Flat 10% minimum – 15% maximum of principal, all tenors
Minimum investment	RWF 5,000
Repayment structure	Fixed monthly instalments of principal plus return
Rating scale	0.0 – 5.0, one decimal, with band word and colour
Rating bands	Strong ≥ 4.0 · Stable ≥ 3.0 · Weak ≥ 2.0 · Distressed < 2.0
Auto-approve DSCR	$\geq 1.25\times$
Audit band DSCR	$1.00\times - 1.25\times$
Reporting window	1st – 7th of each month
Audit Partner dispatch radius	30 km
Audit Partner compensation	25% of the service fee collected
Listing validity	30 days before expiry

B. Glossary

Term	Definition
Note	The instrument issued by a business and held by investors, carrying a fixed total return and a fixed repayment schedule.
Capacity	The maximum a business may raise, computed from verified cash flow. Never negotiable upward.
CFADS	Cash flow available for debt service — verified operating cash flow after existing obligations and owner drawings, volatility-adjusted.
DSCR	Debt service coverage ratio — CFADS divided by the proposed monthly repayment.
Audit Partner	An ICPAR-accredited CPA contracted to perform on-site verification and co-sign reports under ISRS 4400.
Verification seal	A cryptographic hash binding auditor identity, licence, report contents and timestamp to a published report.
Flash Audit	A randomly triggered 24-hour re-verification of a business and its Audit Partner.
Rozine Pulse	The pre-launch demand-aggregation portal. Collects no funds and issues no instrument.
